

Watson Clinic experts are the *Clear Choice* for Treating Cataracts

Cataracts cause a clouding of the eye that often results in blurry vision, glare or shifts in color perception. Cataracts are common as we age, though they may result from factors such as diabetes, smoking or certain medications.

Cataract surgery, which involves the replacement of your eye's lens, is the most common surgical procedure performed in the United States and boasts a remarkable 95% rate of effectiveness. For many years, though, this procedure was performed with stiff lenses, which resulted in multiple stitches and a longer healing period.

**Watson Clinic is proud to offer
state-of-the-art cataract treatment.**

Watson Clinic ophthalmologists – Dr. Musa Awan and Dr. Adam Gant offer a more efficient, minimally invasive procedure with softer lens replacements, no stitches and much smaller incisions. In some situations, the patient can decrease the need for glasses. The new procedure also avoids the need for general anesthesia and allows the patient to return home the day of surgery.

**Advanced cataract treatments are available at the
place you trust most for all of your medical needs.**
